

What are Renewable Energy Credits (RECs)?

A Renewable Energy Certificate (REC) represents the positive environmental attributes of one megawatt hour (MWh) of electricity generated from a renewable electricity resource. Purchasing RECs supports the development of new renewable electricity generation facilities, like solar, wind, geothermal and biomass and helps reduce reliance on fossil fuels.

RECs are a flexible and inexpensive tool to lower emissions associated with purchased electricity, also known as Scope 2 emissions.

RECs can be purchased in a fixed volume, standalone contract and are delivered annually via certificates that convey all environmental attributes, allowing for reduced Scope 2 emission claims.

The Value of RECs:

- Support the growth of renewable electricity generation
- Reduce or eliminate the Scope 2 emissions from the electricity you consume
- Can be purchased locally to support local economies and air quality
- Provides a simple, well-established tool for Scope 2 reductions
- Serves as the primary means to a carbon-neutral electricity product

Twin Eagle's RECs will be sourced from North American wind farms and retired on your behalf in an online tracking system of our choice.
